# WIGO AI Community Manager: Build vs Less Chat

## Recommendation

I'd build WIGO's own system and treat what you and your friend built as an optional channel layer, not the foundation.

## Why

1. The spec needs hard filters on every reply, a separate voice for each account, claims locked to the current rules version, an escalation desk, a kill switch and a weekly learning loop. Less Chat looks like a brand-voice chat workspace. That's a different product, and I'd need to see that it can do those things before relying on it at 49k comments a day.
2. The conversations and the learning data are WIGO's most valuable asset. They should live in our system, not in a shared third-party app.
3. The real blocker is the same either way. Meta, TikTok and WhatsApp have to approve API access whether we build or borrow, so Less Chat doesn't get us around that wait.

## Plan

Build the brain inside the WIGO admin: intent, policy, persona voices, filters, memory and the escalation desk. The channels (Instagram, Facebook, TikTok, WhatsApp) plug in underneath as swappable connectors. They can be Distromatrix's, yours, or direct APIs. That lets us start Week 1 in draft-only mode now, without waiting on approvals, and still hit the Oct 30 financing launch.

## Open questions

- Do Distromatrix's connectors already cover comments, DMs and WhatsApp? The spec says to skip the from-scratch API work if they do.
- Is the WhatsApp number under WIGO's own Meta Business account?

## Next step

Could you send me access to Less Chat, or tell me whether it has an API, per-account personas and reply filters? I'll check whether it can serve as one of the connectors.
